FRANCKEN FRIDAY LECTURE

THE KISS METHOD

FOR 2D MATERIALS & ARPES

BY: ANTONIJA CRUBISIC-CABO

Discover the KISS Method for 2D Materials

Studying the electronic properties of 2D materials requires ultra-clean samples. The KISS method (Kinetic In Situ Single-layer Synthesis) creates large, high-quality flakes directly in ultra-high vacuum, avoiding contamination from air. This simple and reliable approach enables clean samples for ARPES studies – even for air-sensitive materials.

Join the talk to see how KISS opens new possibilities for exploring the physics of 2D materials!
