POLYMER PHYSICS

THE UGLY DUCKLING STORY

BY ANDREA GIUNTOLI

FRIDAY 27TH MARCH - 17:00 - FRANCKEN ROOM

Polymers are ubiquitous yet largely overlooked in physics education. It addresses fundamental questions about polymers, such as the behaviour of rubber bands under heat and the phenomena of liquid freezing without crystallization. Polymer physics, often dismissed as applied and messy, has evolved into a vital multidisciplinary field that has transformed materials, biology, and technology, raising essential questions within physics.
